

SUBTERREAN TERMITE MONITORING

Termites are one of Mother Nature's tree recyclers and as we all know the temperate rainforest habitat we live in is a perfect place for termites to be making their living.

Termites use a technique called "thermo-shadowing" in order to decide where they will come to the surface to forage for food. When a tree falls to the ground it begins to trap moisture under it creating rot and a temperature gradient the termites are able to sense as a food source.

House foundations also mimic this natural thermal gradient and encourage the termites to the surface. They may appear within structures through cracks in the foundation; any wood that may be in contact with the earth; or build protective mud tubes to move from the ground to the wood portion of the structure.

Home Guard™ Termite Monitoring System

We are pleased to have an opportunity to bring to you a termite monitor that closely imitates the thermal shadow termites are searching for. In areas where termites have previously been detected the monitor can be used to identify any part of the colony that may not have been affected by the treat or any additional colonies that may be in the vicinity.

The monitors contain a cellulose matrix which closely mimics the conditions of decaying trees and allows the termites a comfortable place to sub-colonize.

Once detected the bait matrix can be switched to bait that is formulated to be consumed by the members of the colony.

- System includes monitor, and monitor matrix and bait
- Initial set up and one follow up visit (Additional visits beyond contract can be arranged)
- Program cost is \$195 plus \$20.00 per monitoring unit (plus GST)
- Additional visits are \$65.00 per visit (plus GST)
